In-Depth Analysis of Key Questions from May 2009 Paper 2

Let's dissect some representative questions to illustrate effective strategies and common pitfalls.

Example Question 1: Algebra and Functions

Suppose $f(x) = 2x^2 - 3x + 4$. Find the inverse function $f^{-1}(x)$ and determine its domain and range.

Analysis & Approach:

- Step 1: Set $y = 2x^2 - 3x + 4$.
- Step 2: Swap x and y : $x = 2y^2 - 3y + 4$.
- Step 3: Solve for y :

$$2y^2 - 3y + (4 - x) = 0$$

- Step 4: Use the quadratic formula:

$$y = \frac{3 \pm \sqrt{9 - 8(4 - x)}}{4}.$$

- Step 5: Simplify the discriminant:

$$(9 - 32 + 8x = 8x - 23).$$

- Step 6: Write the inverse:

$$f^{-1}(x) = \frac{3 \pm \sqrt{8x - 23}}{4}.$$

- Step 7: Determine the domain of the inverse:

- Inside the square root: $(8x - 23 \geq 0 \Rightarrow x \geq \frac{23}{8})$.

- Step 8: Find the original function's domain:

- Since $f(x)$ is quadratic opening upwards, the range is $f(x) \geq f(\text{vertex})$.

- Vertex at $(x = \frac{3}{4})$:

$$f(0.75) = 2(0.75)^2 - 3(0.75) + 4 = 2(0.5625) - 2.25 + 4 = 1.125 - 2.25 + 4 = 2.875.$$

- So, the range is $[2.875, \infty)$.

Tips: Clearly state each step, especially when solving for the inverse, and specify the domain and range after finding the explicit inverse.

Example Question 2: Calculus and Optimization

A company produces a cylindrical can with volume $(V = \pi r^2 h)$. The material for the sides costs \$0.02 per cm^2 , and the top and bottom cost \$0.03 per cm^2 . Find the dimensions that minimize the

cost for a can with volume 5000 cm^3 .

Analysis & Approach:

- Step 1: Express h in terms of r :

$$h = \frac{V}{\pi r^2} = \frac{5000}{\pi r^2}.$$

- Step 2: Write the total cost $C(r)$:

- Lateral surface area: $2\pi r h$.

- Top and bottom area: $2\pi r^2$.

- Cost:

$$C(r) = 0.02 \times 2\pi r h + 0.03 \times 2\pi r^2.$$

- Step 3: Substitute h :

$$C(r) = 0.02 \times 2\pi r \times \frac{5000}{\pi r^2} + 0.03 \times 2\pi r^2.$$

- Step 4: Simplify:

$$C(r) = 0.02 \times 2 \times 5000 \times \frac{1}{r} + 0.06 \pi r^2,$$

which simplifies to:

$$C(r) = \frac{200}{r} + 0.06 \pi r^2.$$

- Step 5: Find the minimum by differentiating:

$$C'(r) = -\frac{200}{r^2} + 0.12 \pi r.$$

- Step 6: Set derivative to zero:

$$(-\frac{200}{r^2} + 0.12\pi r = 0).$$

- Step 7: Solve for (r) :

$$(0.12\pi r = \frac{200}{r^2}),$$

multiply both sides by (r^2) :

$$(0.12\pi r^3 = 200),$$

$$(r^3 = \frac{200}{0.12\pi}).$$

- Step 8: Calculate (r) :

$$(r = \left(\frac{200}{0.12\pi}\right)^{1/3}).$$

- Step 9: Find (h) :

$$(h = \frac{5000}{\pi r^2}).$$

Tips: Always verify that the critical point corresponds to a minimum by checking the second derivative or the behavior of the cost function.

Common Challenges and How to Overcome Them

- Managing Multi-step Problems

Complex problems often involve multiple concepts. Break them down into smaller parts, solve step-by-step, and verify each.

- Handling Algebraic Manipulations

Errors in algebra are common. Practice simplifying expressions carefully, and check calculations at each step.

- Interpreting Worded Questions

Ensure you understand what is being asked. Highlight key information and underline what you need to find.
