- Vermicular graphite offers intermediate properties, with potential applications in specialized segments.

Microstructural Control

Processing parameters such as cooling rate, alloying, and heat treatment control microstructure formation. For example:

- Rapid cooling favors white cast iron.
- Magnesium treatment promotes spheroidal graphite.
- Austempering can produce bainitic microstructures in ductile cast iron, improving strength and toughness.

The handbook discusses advanced microscopy techniques, including scanning electron microscopy (SEM) and transmission electron microscopy (TEM), to analyze microstructures at the cellular level.

Manufacturing Processes and Quality Control

The production of high-quality cast iron components hinges on precise casting and processing techniques. The ASM handbook examines:

- Melting practices, including electric arc furnace and cupola melting
- Pouring and mold design considerations to minimize defects like porosity and inclusions
