Permissions and Security in Unix

Security is a core feature of Unix. Proper understanding of permissions ensures you protect sensitive data and avoid accidental system modifications.

File Permissions

Each file and directory has permissions divided into three categories:

- **Read (r)**: View the contents.
- **Write (w)**: Modify the contents.
- **Execute (x)**: Run the file as a program.

Permissions are assigned to three entities:

- Owner
- Group
- Others

Managing Permissions

- To view permissions: ``ls -l``
- To change permissions: ``chmod``
- To change ownership: ``chown``

Example:

```
```bash
```

```
chmod 755 filename
```

```
```
```

This command grants read, write, and execute permissions to the owner, and read and execute permissions to group and others.

Advanced Tips for Making Unix Easy

Once comfortable with basic commands, you can explore more advanced features to streamline your workflow.

Using Pipelines and Redirection

- Pipelines (`|``) connect the output of one command to another.
- Redirection (`>`,``

Example:

```
```bash
```

```
ls -l | grep "txt" > text_files.txt
```

```
```
```

This command lists files, filters for "txt", and saves the result.

- Shell scripts automate repetitive tasks.
- Create a script with `.sh` extension and run it with `bash script.sh`.

Package Management

- Install and update software using package managers like `apt` (Debian/Ubuntu), `yum` (CentOS), or `brew` (macOS).

Example:

```
```bash
```

```
sudo apt update
```

```
sudo apt install git
```

```
```
```
