Sample Neuroanatomy MCQs and Detailed Answers

To illustrate the depth and style of neuroanatomy MCQs, here are several representative questions with comprehensive explanations.

Question 1: Which of the following structures is primarily responsible for coordination and balance?

- a) Thalamus
- b) Cerebellum
- c) Basal ganglia
- d) Hippocampus

Answer: b) Cerebellum

Explanation: The cerebellum plays a crucial role in coordinating voluntary movements, maintaining posture, balance, and fine-tuning motor activity. It receives input from sensory systems and other parts of the brain and spinal cord and integrates these to produce smooth, coordinated movements. The thalamus functions as a relay center, the basal ganglia are involved in movement regulation and initiation, and the hippocampus is key in memory formation.

Question 2: Which cranial nerve is responsible for parasympathetic innervation of the thoracic and abdominal viscera?

- a) Cranial nerve V (Trigeminal)
- b) Cranial nerve VII (Facial)
- c) Cranial nerve IX (Glossopharyngeal)
- d) Cranial nerve X (Vagus)

Answer: d) Cranial nerve X (Vagus)

Explanation: The vagus nerve (cranial nerve X) provides extensive parasympathetic innervation to

the heart, lungs, gastrointestinal tract (up to the splenic flexure), and other thoracic and abdominal organs. It is the principal parasympathetic nerve in the body. Cranial nerves V, VII, and IX have different sensory and motor functions but do not provide the widespread parasympathetic innervation seen in the vagus nerve.

Question 3: The corticospinal tract primarily decussates at which level of the central nervous system?

- a) Medulla oblongata
- b) Spinal cord
- c) Pons
- d) Midbrain

Answer: a) Medulla oblongata

Explanation: The majority of the corticospinal fibers decussate at the pyramidal decussation in the medulla oblongata, resulting in contralateral control of limb movements. This crossing explains why lesions above the decussation lead to contralateral deficits, whereas lesions below affect ipsilateral functions.

Question 4: Which of the following arteries supplies the medial surface of the cerebral hemisphere?

- a) Middle cerebral artery
- b) Anterior cerebral artery
- c) Posterior cerebral artery
- d) Basilar artery

Answer: b) Anterior cerebral artery

Explanation: The anterior cerebral artery (ACA) supplies most of the medial cerebral cortex, including parts of the prefrontal and parietal lobes. The middle cerebral artery supplies the lateral surfaces, the posterior cerebral artery supplies the occipital lobes and inferior temporal lobes, and the basilar artery is a major vessel supplying the brainstem and cerebellum.

Question 5: Which structure is part of the limbic system and is involved in emotional processing and memory?

- a) Amygdala
- b) Caudate nucleus
- c) Substantia nigra
- d) Pineal gland

Answer: a) Amygdala

Explanation: The amygdala is a key limbic structure involved in emotional regulation, fear responses, and processing emotional memories. The caudate nucleus is part of the basal ganglia involved in motor control, the substantia nigra in dopamine production, and the pineal gland in regulating circadian rhythms.
