Metaphase

- Chromosomes align at the cell's equatorial plate, forming the metaphase plate.
- Spindle fibers attach to the centromeres of chromosomes.

Anaphase

- Sister chromatids are pulled apart toward opposite poles of the cell.
- Chromatids are now considered individual chromosomes.

Telophase

- Chromosomes reach the poles and begin to de-condense.
- Nuclear envelopes re-form around each set of chromosomes.
- The spindle fibers disassemble.

Cytokinesis

- The cytoplasm divides, resulting in two separate daughter cells.
- In plant cells, a cell plate forms to divide the cytoplasm, whereas animal cells form a cleavage furrow.

Sample Mitosis Lab Onion Root Tip Answer Key

The answer key serves as a guide for identifying and classifying cells in the various stages of

mitosis seen under the microscope. Here is a detailed breakdown:

Identifying Mitosis Stages

- **Interphase:** Cells with a large nucleus containing dispersed chromatin; no visible chromosomes.
- **Prophase:** Cells showing condensed chromosomes, often appearing as distinct X-shaped structures; nuclear envelope absent or dissolving.
- **Metaphase:** Cells where chromosomes are aligned along the metaphase plate; spindle fibers attached to centromeres.
- **Anaphase:** Cells with chromosomes separated and moving toward opposite poles; chromosomes appear as distinct entities moving away from the center.
- **Telophase:** Cells with chromosomes at poles, nuclear envelopes re-forming, and a decrease in visible chromosome condensation.

Counting Cells in Each Stage

To analyze the mitotic activity, count the number of cells in each stage within a sample.

- Ensure to examine multiple fields of view to get an accurate count.
- Record the total number of cells observed.
- Calculate the percentage of cells in each stage by dividing the number of cells in that stage by the total number of cells and multiplying by 100.

Sample Data and Calculations

Suppose in a sample of 100 cells, the following counts are observed:

- Interphase: 70 cells
- Prophase: 10 cells
- Metaphase: 8 cells
- Anaphase: 7 cells
- Telophase: 5 cells

The mitotic index is calculated as:

$$\text{Mitotic Index} = (\text{Number of cells in mitosis} / \text{Total number of cells}) \times 100$$

$$= ((10 + 8 + 7 + 5) / 100) \times 100 = (30 / 100) \times 100 = 30\%$$
