Sample exam for signals and systems is an essential resource for students and professionals aiming to assess and improve their understanding of fundamental concepts in signals and systems. Whether you're preparing for university exams, certification tests, or professional interviews, practicing with sample questions helps identify strengths and weaknesses, enhances problem-solving skills, and builds confidence. In this comprehensive guide, we'll explore key topics covered in signals and systems exams, provide example questions, and offer tips on how to approach and solve them efficiently.

Understanding Signals and Systems

What Are Signals?

Signals are functions that convey information about the behavior or attributes of some phenomenon. They can be classified based on various criteria:

- Continuous-time signals: Defined for every value of time (t) . Example: analog audio signals.
- Discrete-time signals: Defined only at discrete times (n) . Example: digital audio samples.
- Periodic signals: Repeat after a certain interval (T) or (N) . Example: sinusoidal waves.
- Aperiodic signals: Do not repeat periodically.

What Are Systems?

Systems process input signals to produce output signals. They can be characterized by their properties and behavior:

- Linear or Nonlinear: Systems where the principle of superposition applies (linear) versus systems that do not follow this principle.
- Time-Invariant or Time-Variant: Systems whose behavior does not change over time versus those that do.
- Causal or Non-Causal: Systems that depend only on current or past inputs versus those that depend on future inputs.
- Stable or Unstable: Systems where bounded inputs produce bounded outputs versus those that do not.

Sample Exam Questions for Signals and Systems

Preparing for exams requires practicing diverse types of questions. Below are common question categories with sample problems and solutions.

1. Signal Analysis

Question:

Determine whether the following signals are periodic, and if so, find their fundamental periods:

a) $x(t) = \sin(3t) + \cos(5t)$

b) $x[n] = 2 \cos\left(\frac{\pi}{4} n\right)$

Answer:

a) The signal is a sum of two sinusoids with frequencies (3) rad/sec and (5) rad/sec.

- The individual periods are $(T_1 = \frac{2\pi}{3})$, $(T_2 = \frac{2\pi}{5})$.
- To check if the sum is periodic, find the least common multiple (LCM) of these periods.
- Since $(T_1/T_2 = \frac{2\pi/3}{2\pi/5} = \frac{5}{3})$, which is rational, the sum is periodic.
- The fundamental period (T) is the LCM of (T_1) and (T_2) :

$[$

$$T = \text{LCM}\left(\frac{2\pi}{3}, \frac{2\pi}{5}\right) = 2\pi \times \text{LCM}\left(\frac{1}{3}, \frac{1}{5}\right) = 2\pi \times \frac{1}{\text{GCD}(3,5)} = 2\pi \times 1 = 2\pi$$

$]$

- Conclusion: The signal is periodic with fundamental period $(T = 2\pi)$.

b) For the discrete-time signal, the frequency is $(\frac{\pi}{4})$.

- The period in samples is $(N = \frac{2\pi}{(\pi/4)} = 8)$.
- Since (N) is an integer, the signal is periodic with period 8.

2. System Properties and Classification

Question:

Given the system $y(t) = x(t) * h(t)$ where $h(t)$ is an impulse response, determine whether the system is linear, causal, time-invariant, and stable.

Solution:

- Linearity: Convolution is a linear operation, so the system is linear.
- Causality: If $h(t) = 0$ for $t < 0$
- Time-Invariance: Convolution with $h(t)$ does not depend on the absolute time, so the system is time-invariant.
- Stability: If $h(t)$ is absolutely integrable ($\int_{-\infty}^{\infty} |h(t)| dt < \infty$)

3. System Response and Convolution

Question:

Find the output $y(t)$ of the system when the input is $x(t) = u(t)$ (unit step function) and the impulse response is $h(t) = e^{-t} u(t)$.

Solution:

The output is given by the convolution:

$$y(t) = x(t) * h(t) = \int_{-\infty}^{\infty} x(\tau) h(t - \tau) d\tau$$

$$y(t) = \int_{0}^t e^{-(t - \tau)} d\tau = e^{-t} \int_{0}^t e^{\tau} d\tau$$

Calculate the integral:

\[

$$\int_0^t e^{\tau} d\tau = e^t - 1$$

\]

Therefore,

\[

$$y(t) = e^{-t} (e^t - 1) = 1 - e^{-t}$$

\]

Result:

\[

\boxed{\

$$y(t) = 1 - e^{-t}, \quad t \geq 0$$

}

\]
