2. Core Concepts and Definitions

Understanding basic terminology is essential for grasping more complex ideas in bioprocess engineering.

2.1 Bioreactor

A vessel or device designed to support a biologically active environment for cultivating microorganisms, cells, or tissues. It provides controlled conditions such as temperature, pH, oxygen, and agitation.

2.2 Cell Culture

The process of growing cells under controlled conditions, either as adherent cells attached to surfaces or as suspension cultures in a liquid medium.

2.3 Fermentation

A metabolic process where microorganisms convert substrates into products, often in anaerobic or

aerobic conditions. It is a key bioprocess for producing alcohols, organic acids, and other metabolites.

2.4 Substrate

The raw material or nutrient source that microorganisms or cells utilize for growth and product formation (e.g., glucose, lactose).

2.5 Yield Coefficient (Y)

The ratio of the amount of product formed to the amount of substrate consumed, expressed as:

$$Y_{P/S} = \frac{\text{Mass of product}}{\text{Mass of substrate consumed}}$$

2.6 Volumetric Productivity (Qp)

The rate at which product is formed per unit volume of bioreactor per unit time:

$$Q_p = \frac{\text{Mass of product}}{\text{Volume} \times \text{Time}}$$

3. Microorganisms and Cell Culture Basics

Understanding biological systems is fundamental to bioprocessing.

3.1 Types of Microorganisms Used

- Bacteria (e.g., E. coli, Bacillus subtilis)
- Fungi (e.g., Saccharomyces cerevisiae)
- Algae
- Mammalian cells (for complex protein therapeutics)

3.2 Growth Phases

Microbial or cell growth in a batch culture typically passes through distinct phases:

- Lag Phase: Adaptation with minimal cell division.
- Log (Exponential) Phase: Rapid cell division, optimal product formation.
- Stationary Phase: Nutrients deplete, growth ceases, secondary metabolites may form.
- Death Phase: Cell death exceeds new growth.

Understanding these phases helps in optimizing harvest times and maximizing yields.

4. Bioreactor Design and Operation

Designing effective bioreactors requires a deep understanding of physical, chemical, and biological parameters.

4.1 Types of Bioreactors

- Stirred Tank Reactors (STR): Most common; use agitation and aeration.
