## Sample Problem Breakdown: A Typical Question from Test 2 VI

Let's analyze a representative problem to illustrate the approach:

Scenario:

A student is modeling the growth of a bacteria culture over time. The initial population is 100 bacteria, and the population doubles every 3 hours. The student is asked to:

- Develop a model for bacteria growth over time
- Calculate the population after 9 hours
- Interpret what the model suggests about long-term growth

Step-by-step Approach:

### 1. Define Variables and Parameters

Let  $P(t)$  be the population at time  $t$  hours.

Initial population  $P(0) = 100$ .

Doubling time  $T = 3$  hours.

### 2. Construct the Model

Since the bacteria double every 3 hours, the growth is exponential:

$$P(t) = P_0 \times 2^{t/T}$$

$$P(t) = 100 \times 2^{t/3}$$

### 3. Calculate Population after 9 Hours

$$P(9) = 100 \times 2^{9/3} = 100 \times 2^3 = 100 \times 8 = 800$$

### 4. Interpret the Model

The exponential model indicates rapid growth, with the population increasing eightfold every 9 hours. Long-term, this suggests biological limits or resource constraints would eventually slow growth, but within the model's scope, growth continues exponentially.

This example demonstrates how to translate a real-world scenario into a mathematical model, perform calculations, and interpret results—all crucial skills for the **modeling workshop project 2005 test 2 vi**.

## Additional Tips for Success
