Sample Types of Problems in the Mathematics Pythagoras Contest

To illustrate what participants might encounter, here are examples of typical problems:

Example 1: Pythagorean Theorem Application

Given a right-angled triangle with legs of 6 cm and 8 cm, find the length of the hypotenuse.

Solution:

Using the Pythagorean theorem:

$$\text{hypotenuse} = \sqrt{6^2 + 8^2} = \sqrt{36 + 64} = \sqrt{100} = 10 \text{ cm}$$

Example 2: Geometric Construction

Construct a triangle with sides of lengths 7 cm, 24 cm, and 25 cm. Verify if it is a right triangle.

Solution:

Check the Pythagorean relation:

$$7^2 + 24^2 = 49 + 576 = 625$$

$$25^2 = 625$$

Since both are equal, the triangle is right-angled with the hypotenuse of 25 cm.

Example 3: Word Problem

A ladder is leaning against a wall, reaching a height of 12 meters from the ground. The base of the ladder is 5 meters away from the wall. Find the length of the ladder.

Solution:

Apply the Pythagorean theorem:

$$\text{length} = \sqrt{(12^2 + 5^2)} = \sqrt{(144 + 25)} = \sqrt{169} = 13 \text{ meters}$$
